

Precision wind measurements in any configuration, climate or terrain

With over 10 years of experience with wind measurement, Meventus can ensure the measurement quality you need to realize your project with the lowest possible uncertainty

There are many measurement providers in the market today, but none other with the type of organization and background that enables Meventus to provide the high quality measurements we offer today.

We have delivered both measurements and analysis since our early days as a department in a large Norwegian energy utility with a sizable wind project portfolio. Our focus was simple – provide the most value out of our wind projects as possible. Measurement campaigns were planned collaboratively between technicians and wind analysts to provide the lowest uncertainty possible and ensure both the position and sensor configuration are ideal for each specific project and respective climate. While we now serve a wide range of customers in many countries, our focus on quality and project improvement remains unchanged.

To date, we have installed and serviced over 70 masts in the Nordic and Central European region. The majority of these installations are in rough, mountainous and arctic terrain, including the recent installation of a 180m mast outfitted with over 30 sensors for a research project in Southern Sweden. Many of our masts are equipped with a Meventus power supply to power high consumption instrument heating (See our “Hybrid Power Systems” brochure for more information).

In addition to producing our own custom power supplies, we also manufacture our own booms and spires to accommodate any requested sensor configuration, while ensuring the mast is compliant with IEC 61400-12 standards and MEASNET guidelines.

Meventus is also one of Europe's most experienced provider of lidar measurements, having **installed and operated over 20 of leading lidars on the market** (WINDCUBE, ZephIR, Streamline and Galion). We have several systems in-stock and available for rental, including a power supply for remote locations if necessary.

All the major Scandinavian utilities choose Meventus, not only because they require high quality measurements, but because we are top class in Health, Safety, and Environment.

Please contact Meventus for more information on our measurement services, flexible payment plans, and client references.
